Automatic filter AF 119 S

with internal pressure cleaning and integrated cyclone effect Nominal diameter: DN 100, 125, 150, 200

1. Features

Filtration Group automatic backflush filters are suitable for all applications where low or medium-viscosity liquids have to be filtered.

These compact, inline filter systems are designed for automatic cleaning. The system is cleaned by rotating the filter cartridge and backflushing with cleaned internal pressure media.

Advantages:

- Low lifecycle costs because no filter material is consumed
- Cleaning without interrupting filtration
- Precise separation quality in accordance with the surface filter principle
- Top-quality, asymmetric filter medium made of multiple-sintered stainless steel fleece on a robust inner core
- Efficient filter cleaning assures maximum process stability
- Solid construction and high-quality materials for a long service life
- Minimal liquid loss during cleaning
- Filter cleaned one segment at a time with a high backflush pulse
- Actual filter rating and nominal separation are indicated
- Integrated preseparation thanks to tangential inflow and preseparator tube
- Material options open up a wide range of applications(also for high abrasive media)
- Modular Filtration Group Vario system for optimum filter selection
- Optional: Gas-tight shaft seals available
- Optional: Appliction in Ex zone 1 and 2
- Optional Certification for Pressure Equipment Directive (PED)
- Optional: Acceptence for AMSE U-Stamp
- Easy maintenance
- Worldwide distribution

2. Operating principle

The Filtration Group AF 119 S backflush filter belongs to the large Vario series. The compact Filtration Group automatic filter system is used for fine and micro-filtration of a variety of low-viscosity liquids.

This inline pressure filter consumes no filter material, which means there is also no need for subsequent disposal. The filter is cleaned without interrupting operation. The concentrated solids are drained off simply by opening the system for a short time.

The medium to be cleaned is guided into the filter housing under pressure. It flows inward through the Filtration Group segmented element. Particles settle on the surface of the filter medium. The filtered fluid exits the filter housing at the top opposite the inlet connection.

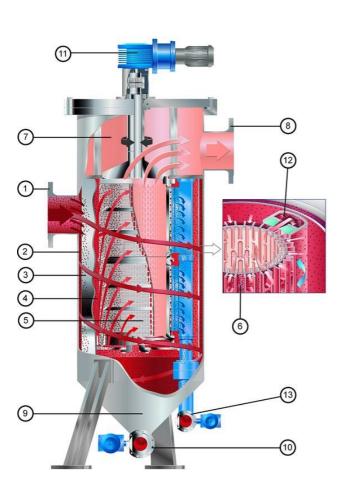

The integrated preseparator relieves the load on the segmented element, particularly from coarse and heavy particles. This permits a tangential flow around the preseparator tube and the deflection edges.

The filter is cleaned when a preset differential pressure limit, a set interval or a defined filtered fluid quantity is reached.

The segmented element is turned as the cleaning and external pressure valves are opened. The segments are then guided one at a time past the outside backflush channel. This causes them to open and close alternately. The internal pressure is built up at a throttle point downstream of the filter, so that when one segment opens, an outward surge cleans the separated particles from the filter material. As a result of this pulse cleaning principle, the particles are catapulted out, collected in the backflush channel and discharged with a small amount of internal medium. One turn suffices to clean all segments.

The residue that has settled in the collection cone can be emptied via the drain valve either when the machine is at a standstill or during filtration.

All filters in the Filtration Group Vario series are protected by various patents.

Used Filtration Group filter cartridges in the AF 119 S backflush filter:

Filtration Group topmesh cartridges (standard)

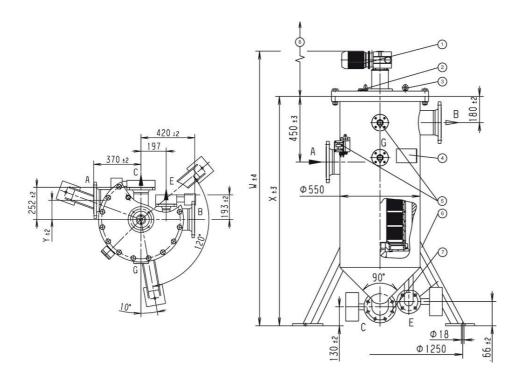

- Good cleanability due to asymmetric design
- Large effective filter surface
- Defined particle retention
- Several material combinations possible

- 1 Inlet connection
- 2 Outer inlet plenum
- 3 Preseparator tube
- 4 Inner inlet plenum
- 5 Filtration Group segmented element
- 6 Filtration Group filter materials
- 7 Plenum for filtered fluid
- 8 Drain connection for filtered fluid
- 9 Residue collection cone
- 10 Drain valve
- 11 Drive motor
- 12 Flushing channel
- 13 Cleaning valve

AF 119 S 2

3. Technical data

- 1 Cleaning drive: can be mounted turned 90°, 180° or 270°
- 2 Vent screw G1/4
- 3 Lifting eyebolts
- Name-plate
- 5 Optional: Differential pressure indicator/switch
- 6 Feet (3 x 120°)
- Optional: Drain valve, manual or automatic mode
- 8 Optional: Automatic backflush valve
- 9 Clearance required = 600 mm

Filter data

Max. operating pressure: 10 bar Max. operating 100 °C

temperature:

Materials: Housing and cover: St. 1.4571

Internals: St. 1.4571

Bearing bushes: PTFE based

Seals: FPM (Viton)

Segmented element: 1.4571/Al (Δp

max. 6 bar)

Cover fastening: 16x M24 hexagon screws

16x M24 hexagon nuts

Connections and nominal diameters: A-inlet, B-outlet: DN 100, DN 125, DN 150, DN 200

C-drain: DN 50 D-gauge DN 25 E-cleaning: DN 50

All threaded holes acc. to DIN 3852

flanges acc. to EN 1092-1/11B1/PN

Drive shaft seal: Lip seal with O-ring Outside coating: Synthetic resin primer,

blue acc. to RAL 5007

Cleaning and emptying

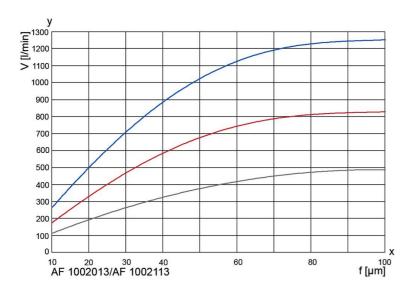

Fully automatic operation:

Filtration usually takes place under pressure. The filter is cleaned after a programmed time or a preset number of cycles or according to the differential pressure. We recommend cleaning the system at a differential pressure of approximately 0.5 to 0.7 bar. The cleaning motor is operated for around 14 s (about one turn of the filter cartridge). The cleaning valve remains open for this period. An internal pressure of 2 to 3 bar suffices to clean the filter thoroughly. The drain valve is opened in order to empty the filter. Depending on the residue concentration, this can either take place directly after cleaning or be time or cycle controlled. The opening time of the drain valve is 2 to 3 s.

Refer to the Instruction Manual for further information.

Filtration Group's team of specialists will be pleased to assist in any way. Tests can be carried out in the absence of reliable evaluation criteria.

5. Efficiency curves

The curves indicate the volume flow through the complete filter system (filter housing including cartridge) and are referred to a differential pressure of 0.3 bar. Specific process information is essential to guarantee reliable operation of an automatic filter.
